

### UNDERWATER THROAT PHONES

GAMSRO **underwater throat microphones** are made with special vibration sensors. One part touches the user's ear and the other on his neck near his vocal cords. The sensor receives only the vibration signals of the skin produced by them. Since many tasks do not have a microphone supply, GAMSRO's underwater throat phones are an excellent choice for diver's communication with the surface during diving. The underwater throat phones can be used safely as they are placed outside the mask and therefore do not jeopardize the breathable air supply, nor do they violate the approvals and certifications of the mask.
